

I've spent the last decade building high-performance platforms, but my real passion lies in creating lean, "no-bloat" software that actually scales. Whether I'm launching an MVP from scratch in three months or developing my own frameworks like `nodes.js` and `EHTML`, I love finding elegant ways to solve complex architectural puzzles. I've led teams through massive infrastructure migrations and cut operational costs by focusing on performance at every level. I'm looking for a place where I can dive into the code and help build something truly efficient, and I'd love to chat about how my background fits your team's goals.
